

Machining Operations Performed On Turning Centers

by Mike Lynch

Copyright 2006 - CNC Concepts, Inc.

Table of contents:

Navigating this eBook 4

Getting around 4

Licensing agreement 4

The importance of basic machining practice to CNC people 5

The three general turning applications 11

Shaft work 11

Chucking work 13

Bar work 14

How a cutting tool works 16

External versus internal work 17

Roughing versus finishing operations 18

*Machining operations performed by single point cutting tools
20*

Components of a single point cutting tool 22

The insert 22

The tool holder 24

Right hand versus left hand cutting tools 26

More about the geometry of a single point cutting tool 29

Lead angle, nose angle, clearance angle 29

Nose radius 30

Rake and relief angle 30

Other attributes of single point cutting tools 31

Chip breaker 31

Clamp and retaining pin 32

The difference between indexing and replacing an insert 32

Tool life 33

Chatter (vibration) 34

Part finish 34

Seat 34

How carbide inserts are specified 34

Machining Operations Performed On Turning Centers

First letter (shape): 35
Second letter (relief angle): 35
Third letter (tolerances): 36
Fourth letter (type of insert) 37
First digit (size of insert) 37
Second digit (thickness) 38
Third digit (tool nose radius) 38

Understanding wear on single point cutting tools 38

Introduction to cutting conditions 41

The two ways to specify spindle speed 41

The two ways to specify feedrate 42

Getting recommendations for cutting conditions 43

Use of coolant 43

The machining process 45

Rough facing 46

More on depth-of-cut 46

Roughing facing all external raw material 47

Finishing stock – on diameters and faces 48

Cutting conditions for facing 48

Cutting tools used for rough facing 50

Sizing adjustments needed during the life of the rough facing tool 52

Rough Turning 52

More on depth-of-cut 53

Finishing stock – on diameters and faces 53

Cutting conditions for rough turning 54

Cutting tools used for rough turning 55

A note about back turning 57

Sizing adjustments needed during the life of the rough turning tool 58

Drilling 58

Cutting conditions for drilling 60

Other types of drills 60

Spade drills 60

Carbide insert drills 61

Sizing adjustments needed during the life of a drill 61

Rough boring 62

More on depth-of-cut 63

About length-to-diameter ratio 63

Finishing stock – on diameters and faces 64

Cutting conditions for rough boring 64

Cutting tools used for rough boring 66

Sizing adjustments needed during the life of the rough boring bar 67

Where we stand in the process 68

Finish facing and turning 69

A note about the finishing stock left on faces 70

Understanding surface finish requirements 70

Cutting conditions for finish facing and turning 72

Cutting tools used for finish facing and turning 73

Sizing adjustments needed during the life of the finish facing and turning tool 74

Machining Operations Performed On Turning Centers

Finish boring 76

- A note about the finishing stock left on faces 77
- Understanding surface finish requirements 77
- Cutting conditions for finish facing and turning 77
- Cutting tools used for finish boring 78
- Sizing adjustments needed during the life of the finish boring bar 78

Other common machining operations 79

Necking 79

- Cutting conditions for necking 81

Parting 81

Threading 82

- Cutting conditions for threading 84
- Cutting tools for threading 84
- Measuring threads 85
- Machining internal threads 87

Sizing adjustments needed during the life of a threading tool 87

Websites that provide cutting tool information 88

- Drilling 88
- General information 88
- Software 88
